To whom it may concern,

Before I was an effective Sciton user, I was a Cutera user. After running through 4 ProWave 770 heads in a few months, numerous representative changes who promised me many things that went unfulfilled, and using an Cutera IPL device that only limited me to using only the 560 spectrum of light, I went back to educating my self on the utilities of my Sciton. It's no wonder that every long time user of aesthetic lasers I spoke with raved about the Sciton. The erbium component is so user friendly, precise in its depth of penetration, create effective treatments and versatile. I can do the most superficial skin rejuvenation or the deepest resurfacing for deep scars with the Sciton erbium.

Adding the BBL device has opened up a whole new treatment world to me. I can treat hair in all skin types and more effectively with the IPL and Nd:Yag 1064 combination. The BBL is so much easier to use than other IPL devices because the sapphire crystal is so large it makes it easy to see where you're treating. The cooling delivered by the crystal makes treatments so much more comfortable than other devices. Additionally, patients notice a much greater effectiveness of treatment than other IPL treatments.

Patients just love the Skin-Tyte component because it causes no down time and is painless and effective no matter where we've used it. It's been exciting to see the changes in the loose skin of the abdomen, underarms as well as the face and neck. As a user, it's great not to have the disposable cost and cause no pain unlike other tightening devices on the market. I can't believe that ethics of a company like Sciton to produce a product that can do so many treatments without disposables. It's a huge saving for the patient and the users.

The Profractional device has been so effective by itself or when used in combination to improve scars and diminish very deep wrinkles. Patients love it and keep coming back for repetitive treatments. The couple days of down time is worth it for the degree of improvement patients see. Compared to the original Fraxel with multiple treatments and numerous treatments with longer down times, the Profractional device is simply superior. The numerous options for depth control as well as percentage of treatment area makes this device so flexible and utilitarian for so many skin problems.

The Sciton has provided in one platform so many treatment modalities that I can offer to my patient. They are also so effective that I can honestly tell patients that they will see significant differences, improvements in their skin with or without down time.

Support has been outstanding! I can contact any of their expert physicians from Dr. Pozner to Dr. Remington. Amazingly, they respond right away despite their busy schedules. Additionally, on the rare occasion when I've had a problem with the Sciton, I've had immediate response. With a simple phone call even on the weekend, I've had a prompt and professional reply.

I still am working on learning all the utilities of my Sciton, but I am so excited. Having used CO2 lasers for so many years, I am continually surprised by the versatility and power of the Sciton.

I have patients who had CO2 resurfacing and had improvement of their acne scars but would never do another CO2 resurfacing because of the pain and incredibly recovery process. Yet, they come for Profractional and MLP combinations because of the tolerability of the procedure itself and so much shorter healing times.

The web seminars are always given by outstanding members of the laser community. They are incredibly educational because the speakers are so generous in sharing their knowledge and so experienced with the device.

In hindsight, I chuckle when I think about the fact that I almost sold my Sciton a few years back. Greater knowledge about the power of this device, a great company representative and regional manager, as well as incredible support have made me a Sciton loyalist.

Sincerely,
Estelle Yamaki, M.D., FACOG
